# Constraint Satisfaction Problems

---

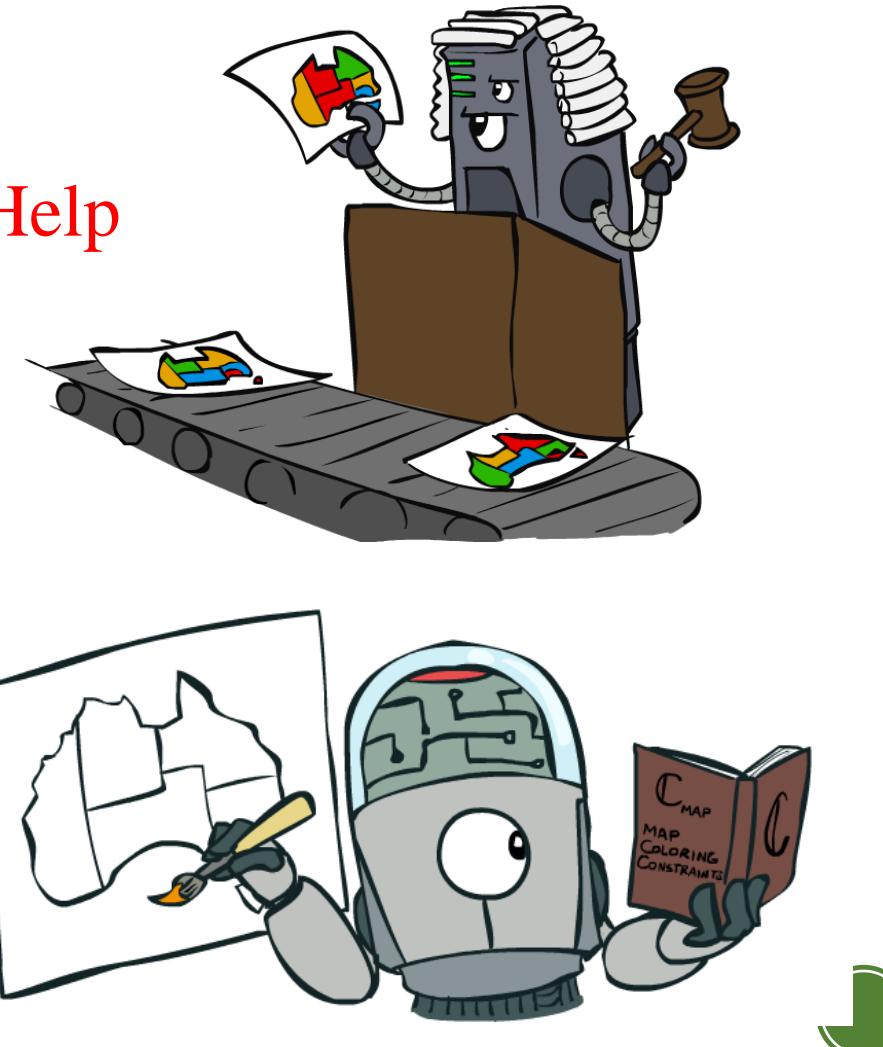

# Constraint Satisfaction Problems

- Standard search problems:
  - State is a “black box”: arbitrary data structure
  - Goal test can be any function over states
  - Successor function can also be anything
- Constraint satisfaction problems (CSPs):
  - A special subset of search problems
  - State is defined by variables  $X_i$  with values from a domain  $D$  (sometimes  $D$  depends on  $i$ )
  - Goal test is a set of constraints specifying allowable combinations of values for subsets of variables
- Allows useful general-purpose algorithms with more power than standard search algorithms

# CSP Examples

---

# Example: Map Coloring

- Variables: WA, NT, Q, NSW, V, SA, T
- Domains:  $D = \{\text{red, green, blue}\}$

- Constraints: adjacent regions must have different colors

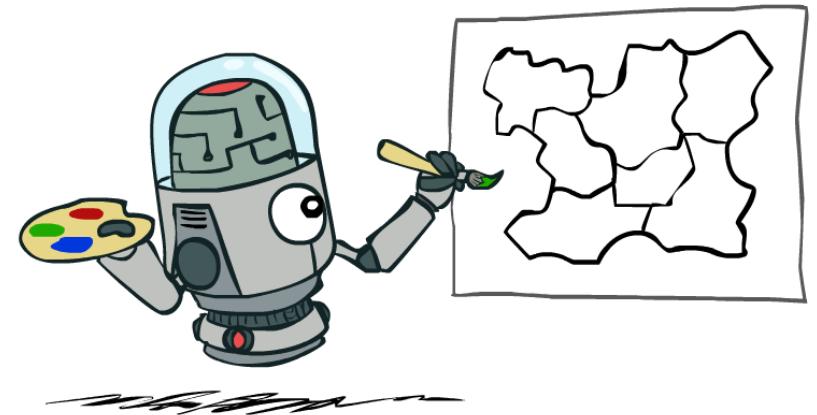

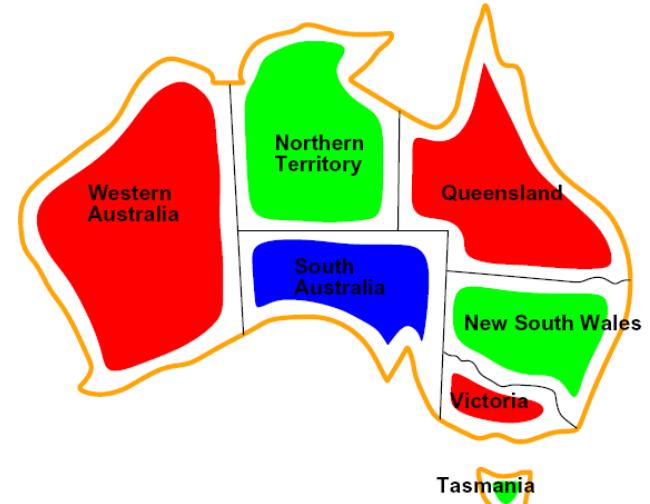

Implicit:  $\text{WA} \neq \text{NT}$

Explicit:  $(\text{WA}, \text{NT}) \in \{(\text{red, green}), (\text{red, blue}), \dots\}$

- Solutions are assignments satisfying all constraints, e.g.:

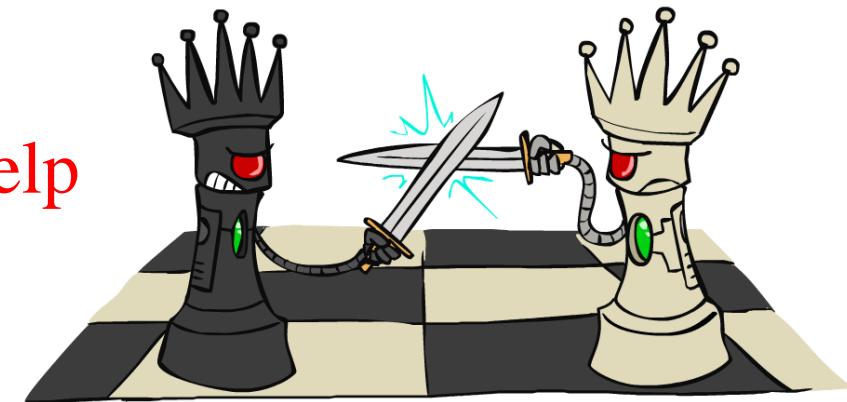

$\{\text{WA=red, NT=green, Q=red, NSW=green, V=red, SA=blue, T=green}\}$

WeChat: cstutorcs

# Example: N-Queens

- Formulation 1:
  - Variables:  $X_{ij}$
  - Domains:  $\{0, 1\}$
  - Constraints

WeChat: cstutorcs

$$\forall i, j, k \quad (X_{ij}, X_{ik}) \in \{(0, 0), (0, 1), (1, 0)\}$$

$$\forall i, j, k \quad (X_{ij}, X_{kj}) \in \{(0, 0), (0, 1), (1, 0)\}$$

$$\forall i, j, k \quad (X_{ij}, X_{i+k, j+k}) \in \{(0, 0), (0, 1), (1, 0)\}$$

$$\forall i, j, k \quad (X_{ij}, X_{i+k, j-k}) \in \{(0, 0), (0, 1), (1, 0)\}$$

$$\sum_{i,j} X_{ij} = N$$

# Example: N-Queens

- Formulation 2:

- Variables:  $Q_k$

Assignment Project Exam Help

- Domains:  $\{1, 2, 3, \dots, N\}$

<https://tutorcs.com>

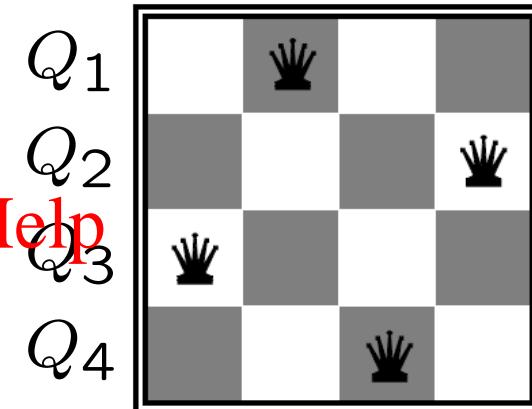

- Constraints:

WeChat: cstutorcs

Implicit:  $\forall i, j \text{ non-threatening}(Q_i, Q_j)$

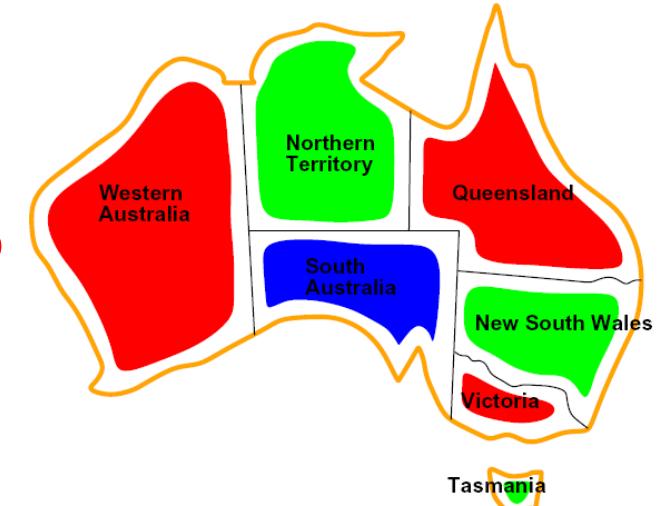

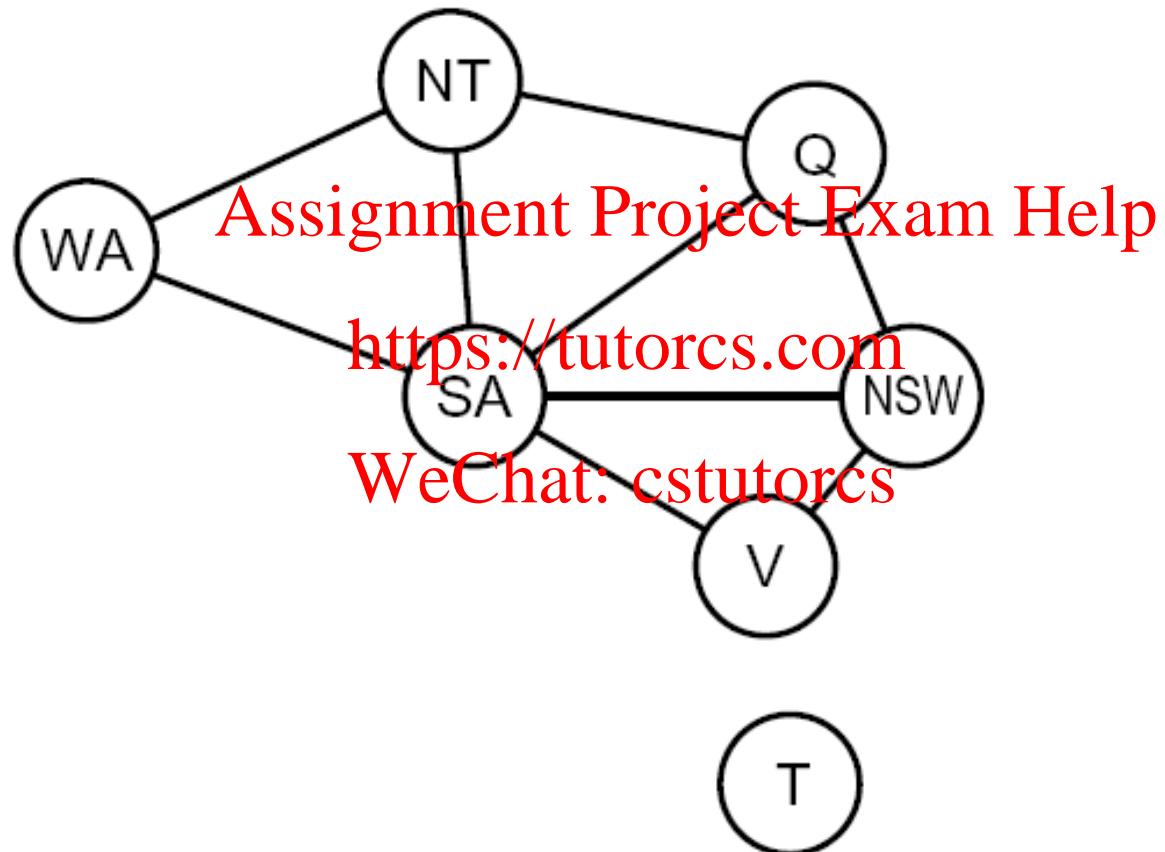

Explicit:  $(Q_1, Q_2) \in \{(1, 3), (1, 4), \dots\}$

...

# Constraint Graphs

---

# Constraint Graphs

---

- Binary CSP: each constraint relates (at most) two variables

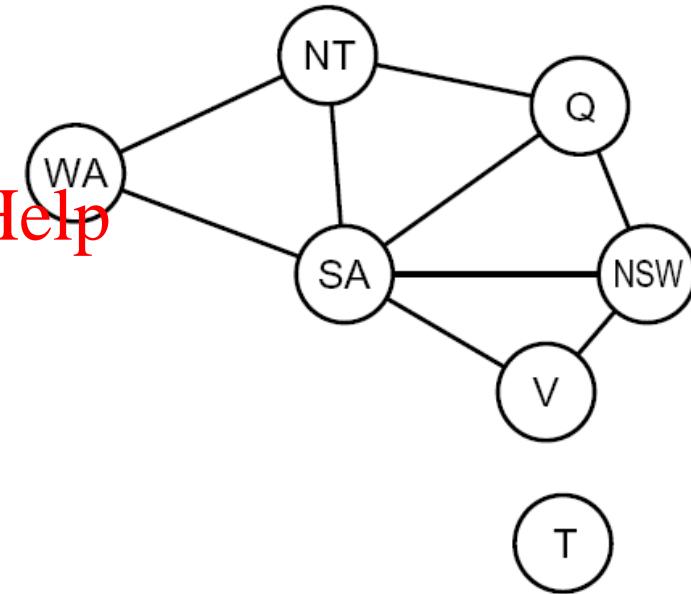

Assignment Project Exam Help

- Binary constraint graph: nodes are variables, arcs show constraints

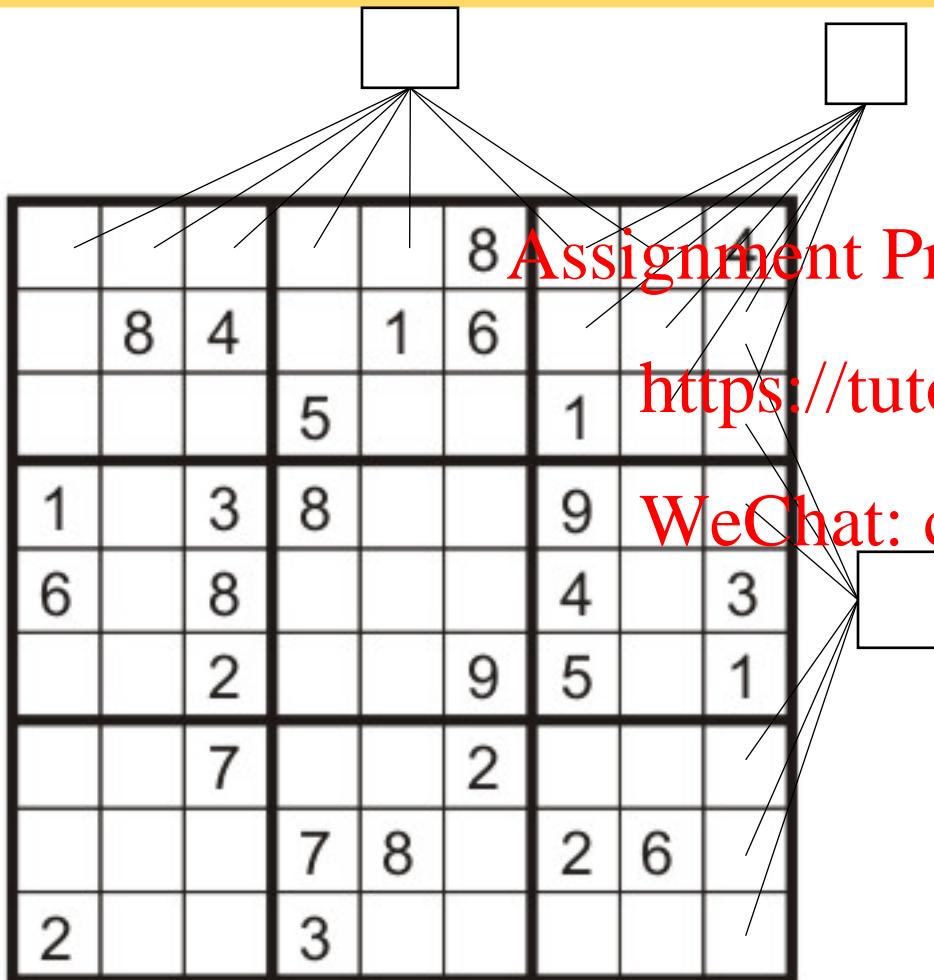

<https://tutorcs.com>

WeChat: cstutorcs

- General-purpose CSP algorithms use the graph structure to speed up search. E.g., Tasmania is an independent subproblem!

# Example: Sudoku

- Variables:
  - Each (open) square
    - $\{1,2,\dots,9\}$
- Constraints:
  - 9-way alldiff for each column
  - 9-way alldiff for each row
  - 9-way alldiff for each region
  - (or can have a bunch of pairwise inequality constraints)

# Varieties of CSPs and Constraints

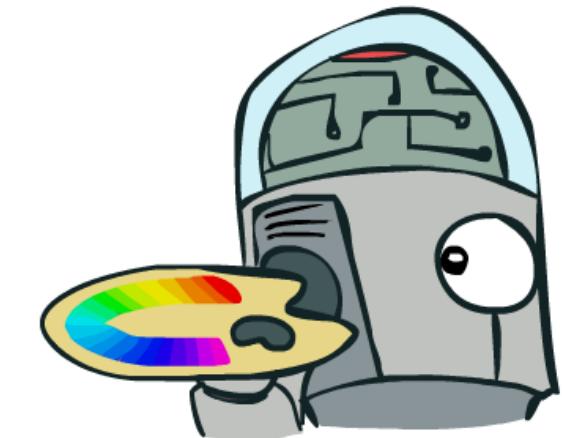

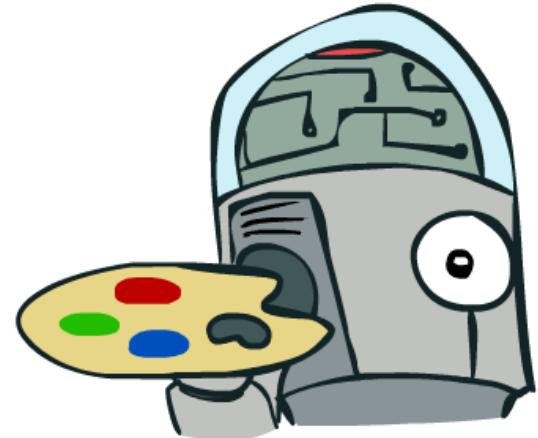

---

# Varieties of CSPs

---

- Discrete Variables
  - Finite domains
    - E.g., Boolean CSPs, including Boolean satisfiability (NP-complete)  
**Assignment Project Exam Help**
  - Infinite domains (integers, strings, etc)  
**https://tutorcs.com**
    - E.g., job scheduling, variables are start/end days for each job  
**WeChat: cstutorcs**
- Continuous variables
  - E.g., start/end times for Hubble Telescope observations

# Varieties of Constraints

---

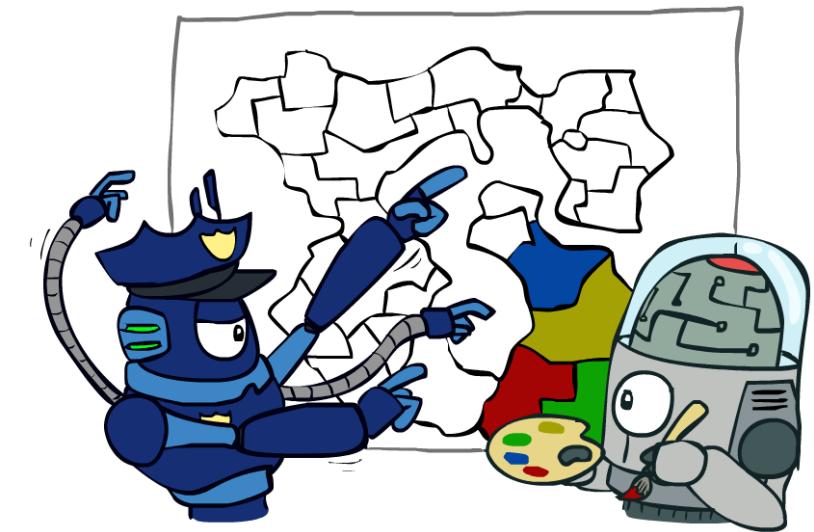

- Varieties of Constraints

- Unary constraints involve a single variable (equivalent to reducing domains), e.g.:  $SA \neq \text{green}$
- Binary constraints involve pairs of variables, e.g.:  $SA \neq WA$
- Higher-order constraints involve 3 or more variables

WeChat: cstutorcs

- Preferences (soft constraints):

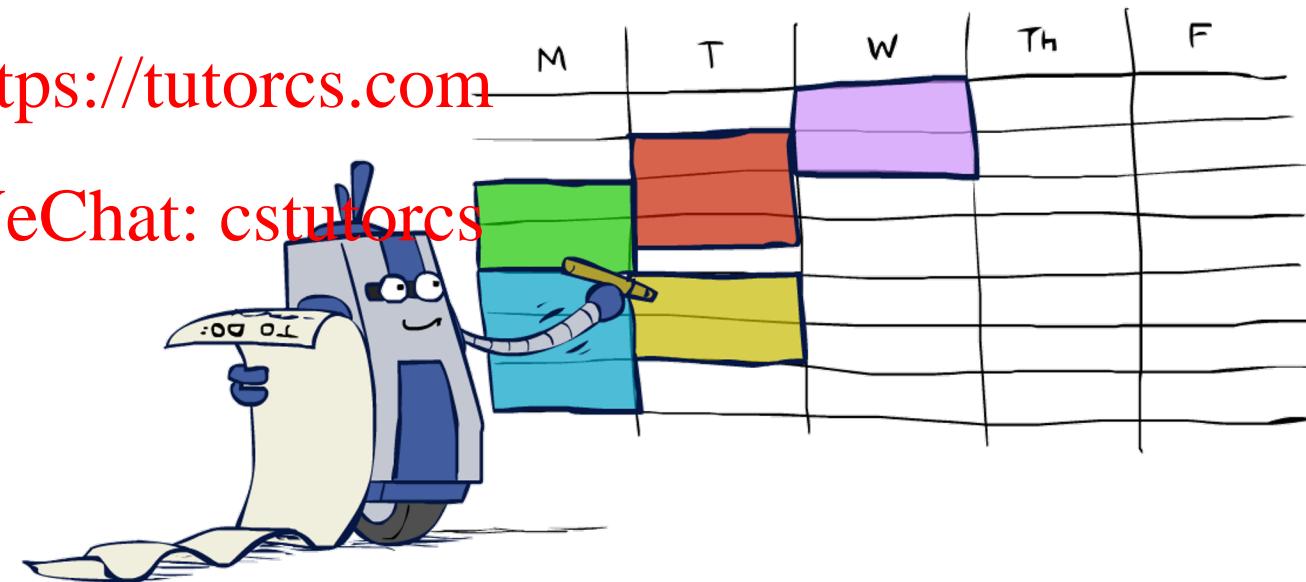

- E.g., red is better than green
- Often representable by a cost for each variable assignment
- Gives constrained optimization problems

# Real-World CSPs

---

- Scheduling problems: e.g., when can we all meet?
- Timetabling problems: e.g., which class is offered when and where?
- Assignment problems: ~~Assignment Project Exam Help~~
- Hardware configuration <https://tutorcs.com>
- Transportation scheduling
- Factory scheduling
- Circuit layout
- Fault diagnosis
- ... lots more!
- Many real-world problems involve real-valued variables...

# Solving CSPs

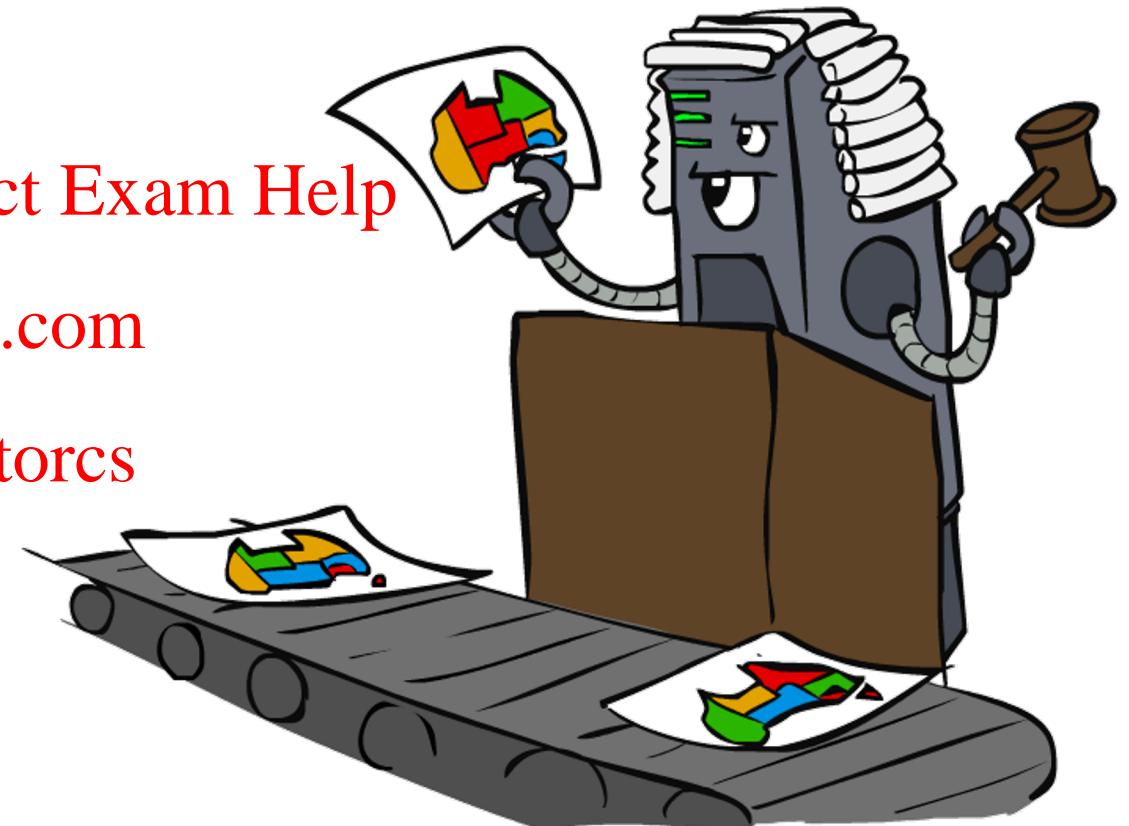

---

# Standard Search Formulation

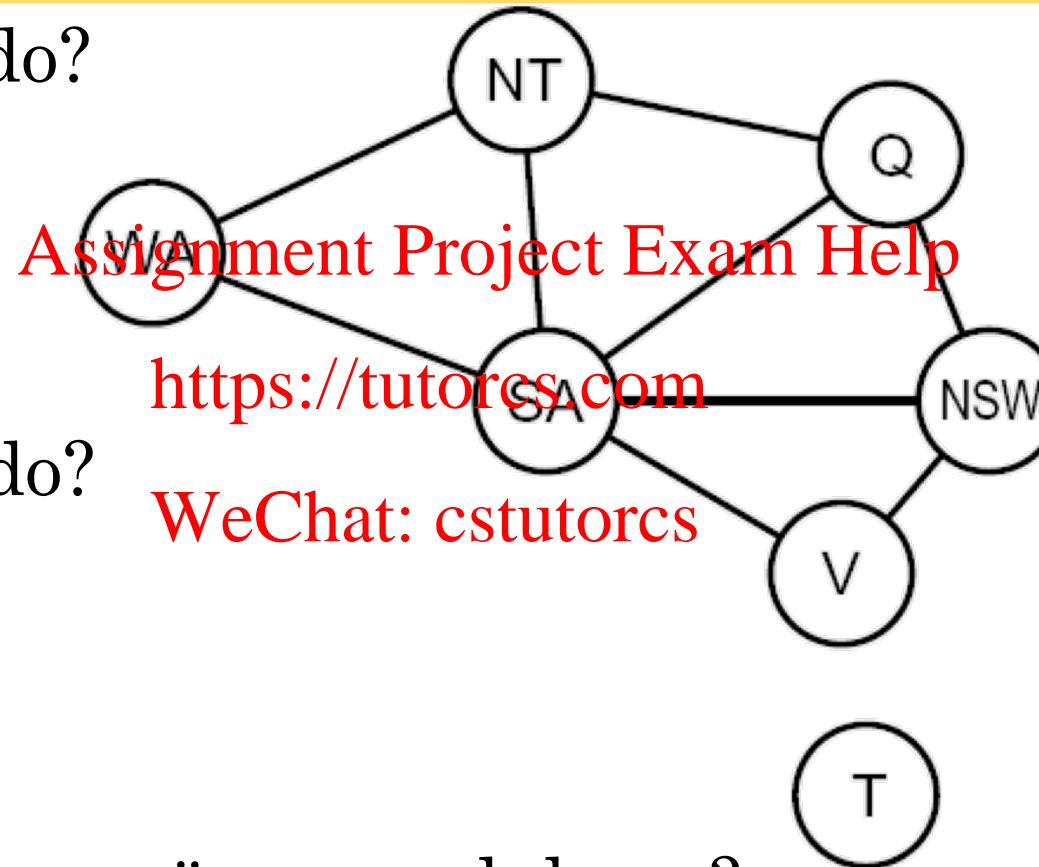

---

- Standard search formulation of CSPs
- States defined by the ~~Assignment Project Exam Help~~ so far (partial assignments)
  - Initial state: the empty assignment
  - Successor function: assign a value to an unassigned variable
  - Goal test: the current assignment is complete and satisfies all constraints
- We'll start with the straightforward, naïve approach, then improve it

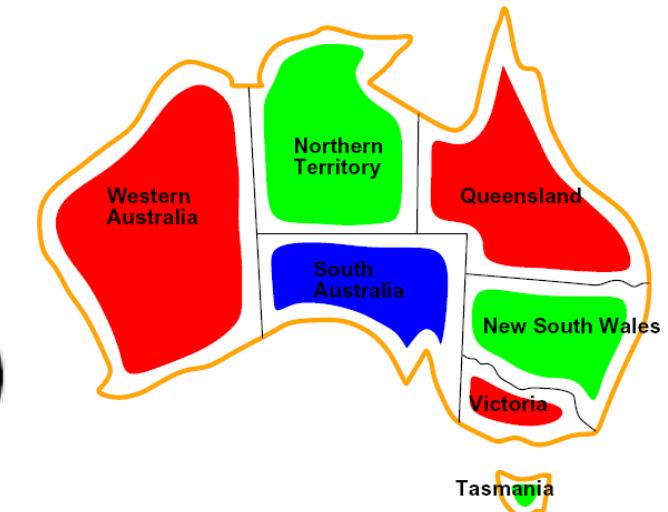

# Search Methods

- What would BFS do?

- What would DFS do?

- What problems does naïve search have?

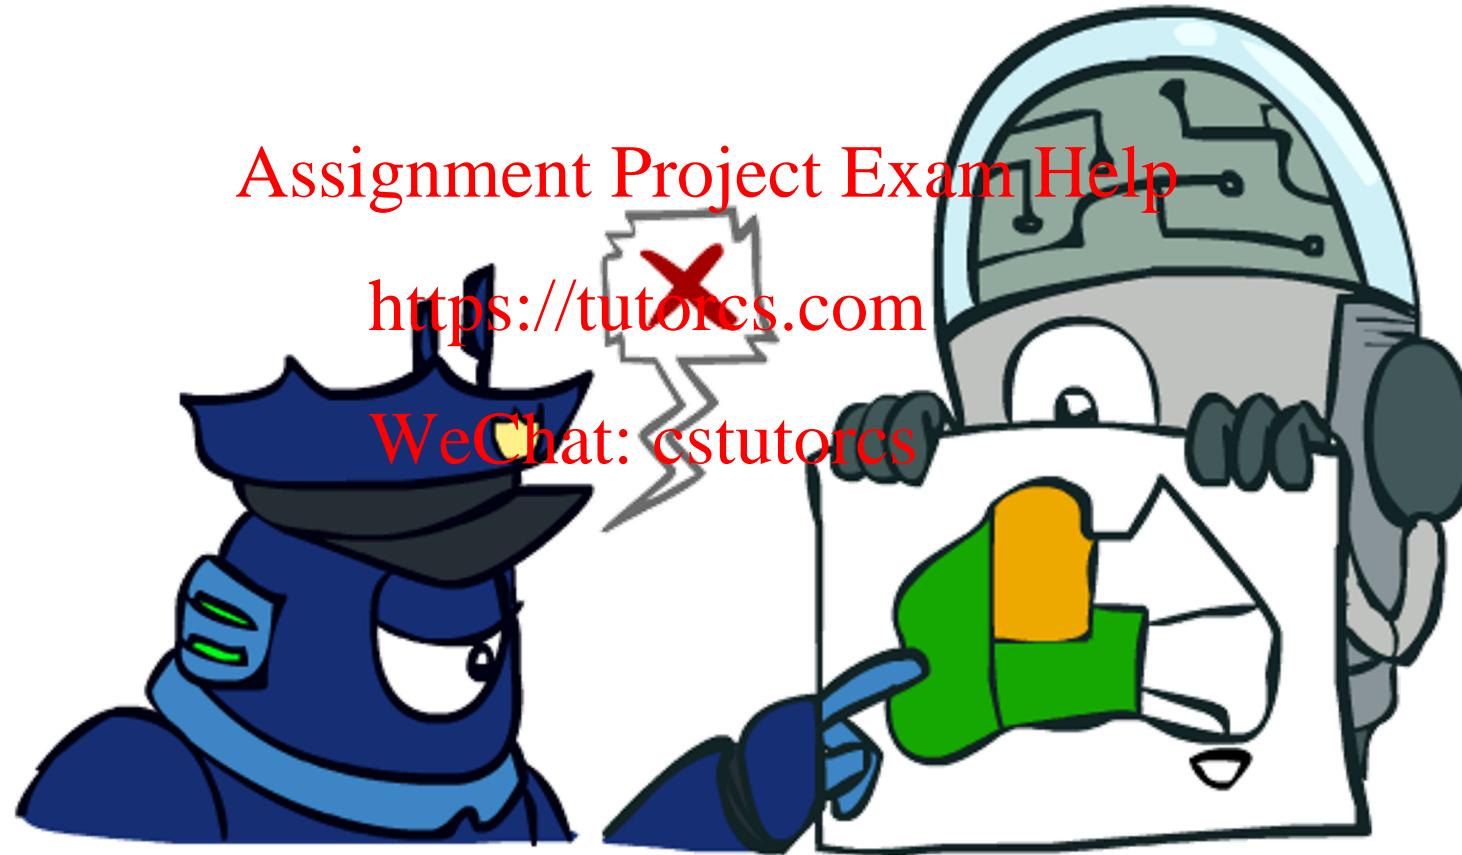

# Backtracking Search

---

Assignment Project Exam Help

<https://tutorcs.com>

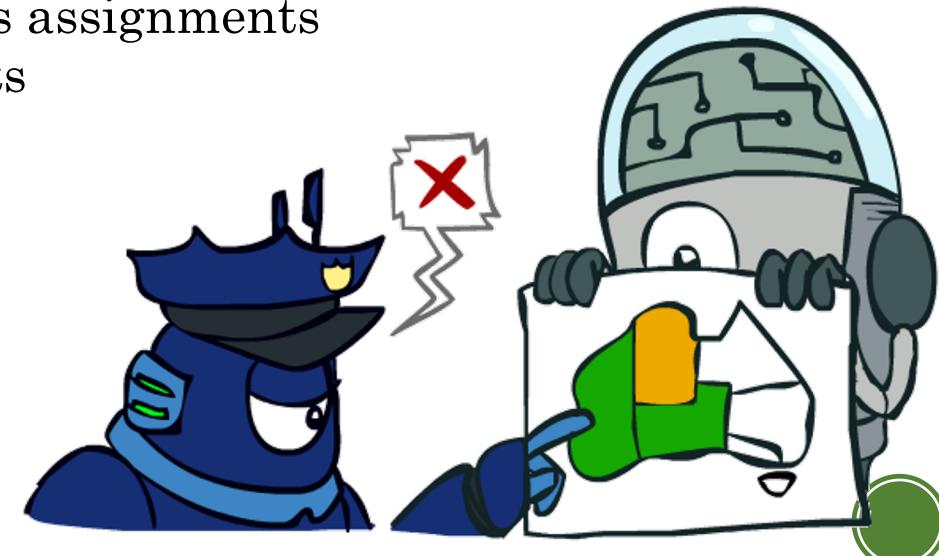

WeChat: cstutorcs

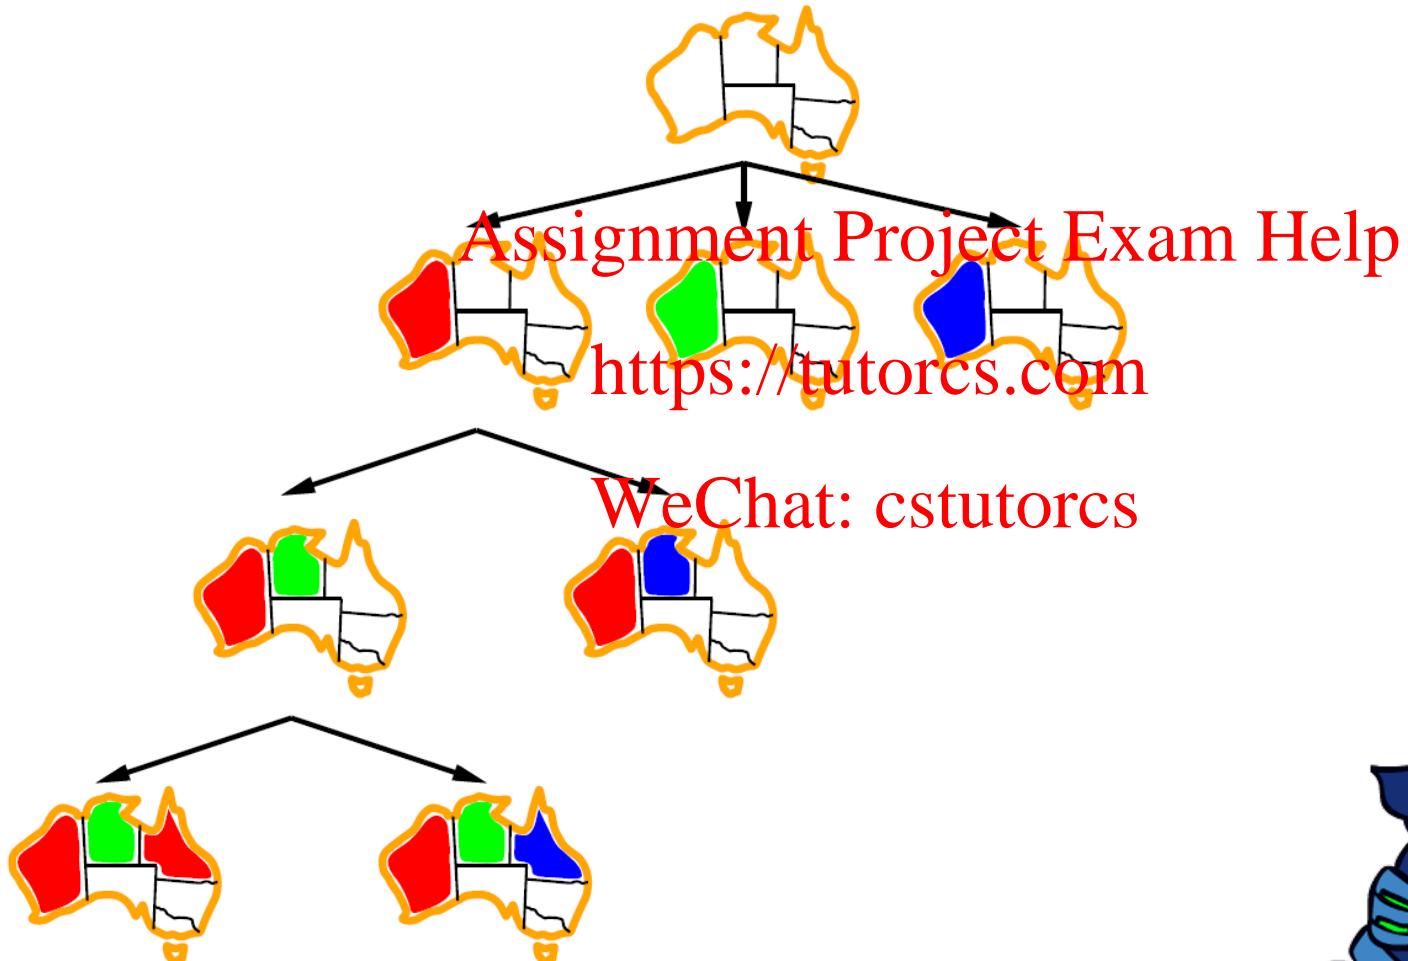

# Backtracking Search

---

- Backtracking search is the basic uninformed algorithm for solving CSPs
- **Idea 1: One variable at a time**
  - Variable assignments are commutative, so fix ordering
  - I.e., [WA = red then NT = green] same as [NT = green then WA = red]
  - Only need to consider assignments to a single variable at each step  
<https://tutorcs.com>
- **Idea 2: Check constraints as you go**
  - I.e. consider only values which do not conflict with previous assignments
  - Might have to do some computation to check the constraints
  - “Incremental goal test”
- Depth-first search with these two improvements is called *backtracking search* (not the best name)
- Can solve n-queens for  $n \approx 25$

# Backtracking Example

# Backtracking Search

```
function BACKTRACKING-SEARCH(csp) returns solution/failure
  return RECURSIVE-BACKTRACKING({ }, csp)
function RECURSIVE-BACKTRACKING(assignment, csp) returns soln/failure
  if assignment is complete then return assignment
  var  $\leftarrow$  SELECT-UNASSIGNED-VARIABLE(VARIABLES[csp], assignment, csp)
  for each value in ORDER-DOMAIN-VALUES(var, assignment, csp) do
    if value is consistent with assignment given CONSTRAINTS[csp] then
      add {var = value} to assignment
      result  $\leftarrow$  RECURSIVE-BACKTRACKING(assignment, csp)
      if result  $\neq$  failure then return result
      remove {var = value} from assignment
  return failure
```

- Backtracking = DFS + variable-ordering + fail-on-violation
- What are the choice points?

# Improving Backtracking

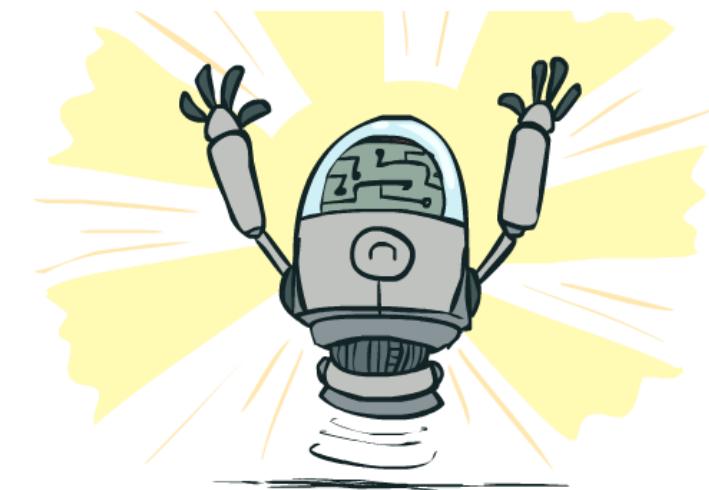

---

- General-purpose ideas give huge gains in speed
- Ordering:
  - Which variable should be assigned next?
  - In what order should its values be tried?
- Filtering: Can we detect inevitable failure early?
- Structure: Can we exploit the problem structure?

Assignment Project Exam Help

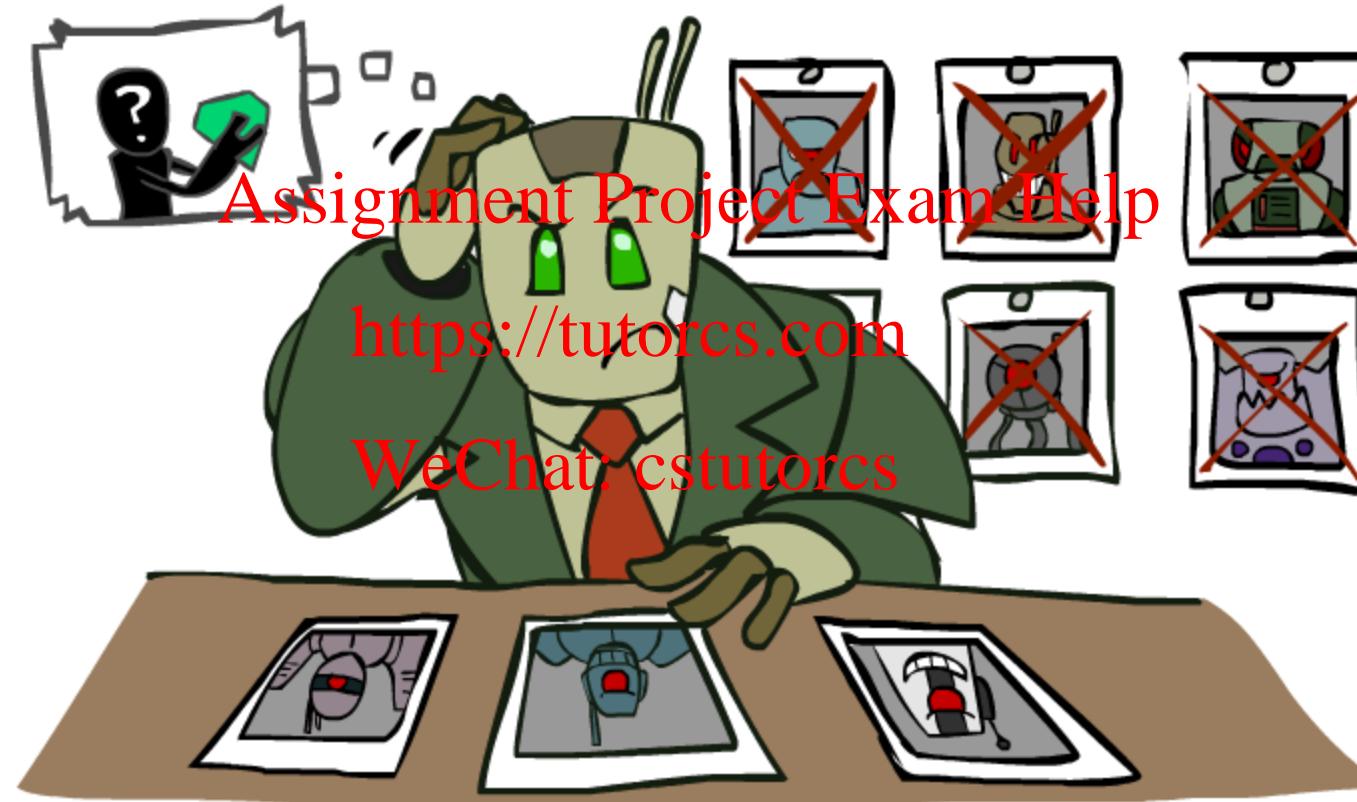

<https://tutorcs.com>

WeChat: cstutorcs

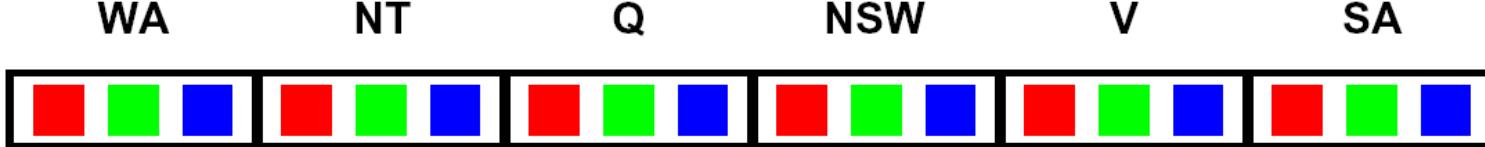

# Filtering

---

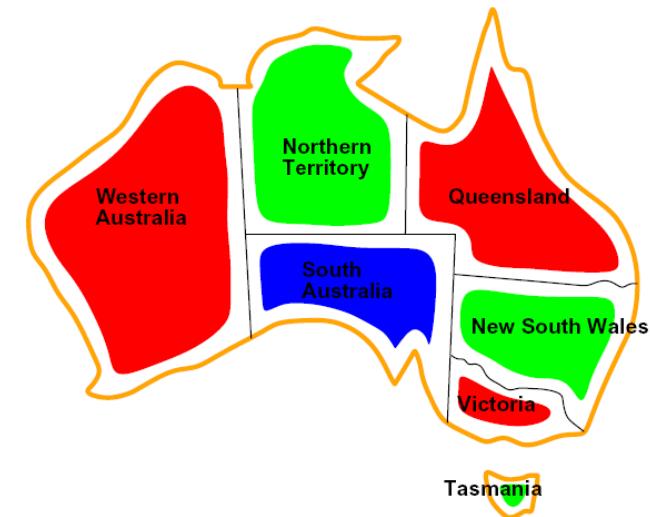

# Filtering: Forward Checking

- Filtering: Keep track of domains for unassigned variables and cross off bad options
- Forward checking: Cross off values that violate a constraint when added to the existing assignment

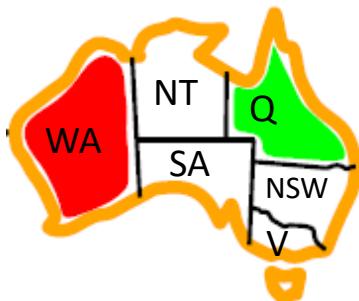

<https://tutorcs.com>

WeChat: cstutorcs

# Filtering: Constraint Propagation

- Forward checking propagates information from assigned to unassigned variables, but doesn't provide early detection for all failures:

Assignment Project Exam Help

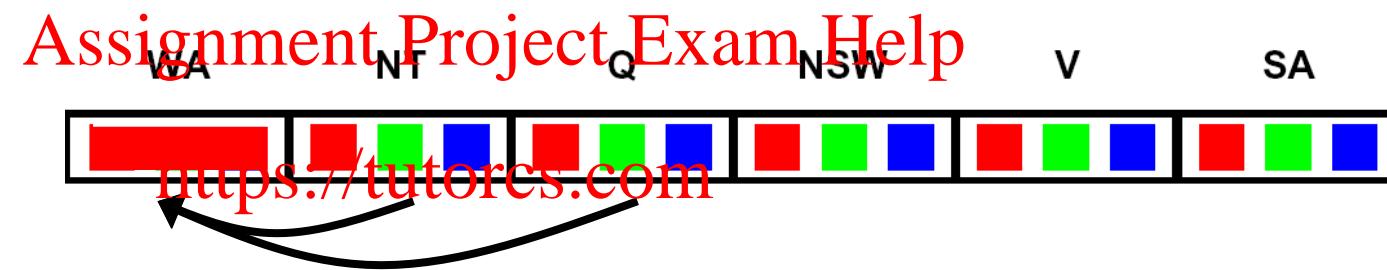

WA	NT	Q	NSW	V	SA
https://tutorcs.com					
					WeChat: cstutorcs

- NT and SA cannot both be blue!
- Why didn't we detect this yet?
- *Constraint propagation*: reason from constraint to constraint

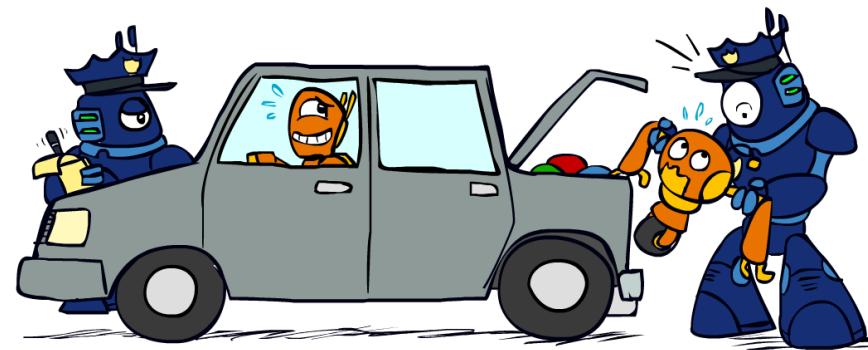

# Consistency of A Single Arc

- An arc  $X \rightarrow Y$  is **consistent** iff for *every*  $x$  in the tail there is *some*  $y$  in the head which could be assigned without violating a constraint

WeChat: cstutorcs

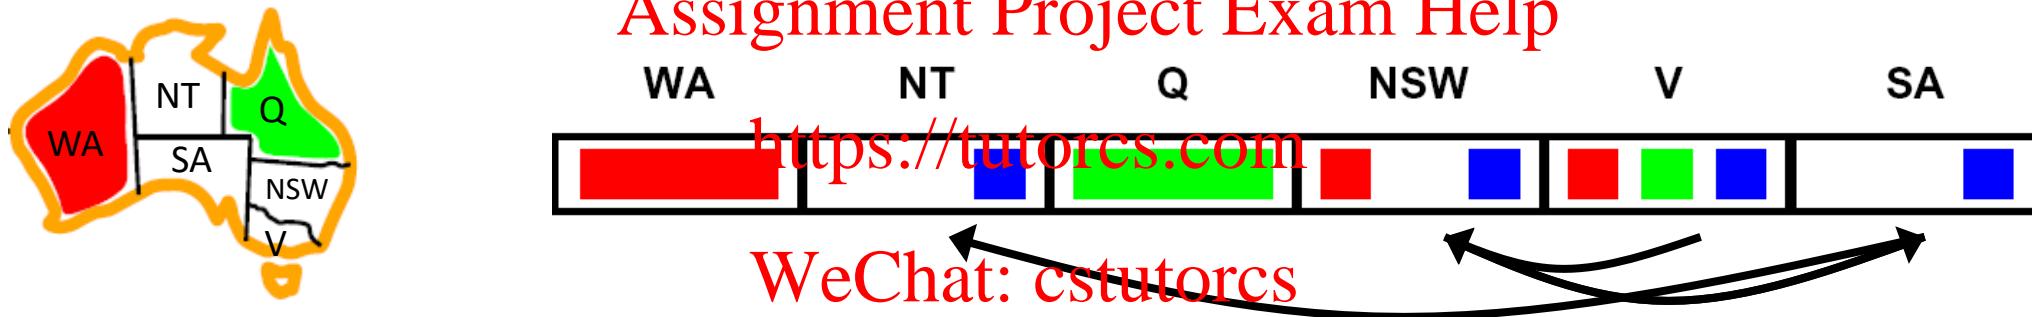

*Delete from the tail!*

- Forward checking: Enforcing consistency of arcs pointing to each new assignment

# Arc Consistency of an Entire CSP

- A simple form of propagation makes sure **all** arcs are consistent:

- Important: If X loses a value, neighbors of X need to be rechecked!
- Arc consistency detects failure earlier than forward checking
- Can be run as a preprocessor or after each assignment
- What's the downside of enforcing arc consistency?

*Remember:  
Delete from  
the tail!*

# Enforcing Arc Consistency in a CSP

```
function AC-3( csp ) returns the CSP, possibly with reduced domains
  inputs: csp, a binary CSP with variables  $\{X_1, X_2, \dots, X_n\}$ 
  local variables: queue, a queue of arcs, initially all the arcs in csp

  while queue is not empty do
     $(X_i, X_j) \leftarrow \text{REMOVE-FIRST}(\text{queue})$ 
    if REMOVE-INCONSISTENT-VALUES( $X_i, X_j$ ) then
      for each  $X_k$  in NEIGHBOURS[ $X_i$ ] do
        add  $(X_k, X_i)$  to queue

---

function REMOVE-INCONSISTENT-VALUES( $X_i, X_j$ ) returns true iff succeeds
  removed  $\leftarrow \text{false}$ 
  for each  $x$  in DOMAIN[ $X_i$ ] do
    if no value  $y$  in DOMAIN[ $X_j$ ] allows  $(x, y)$  to satisfy the constraint  $X_i \leftrightarrow X_j$ 
      then delete  $x$  from DOMAIN[ $X_i$ ]; removed  $\leftarrow \text{true}$ 
  return removed
```

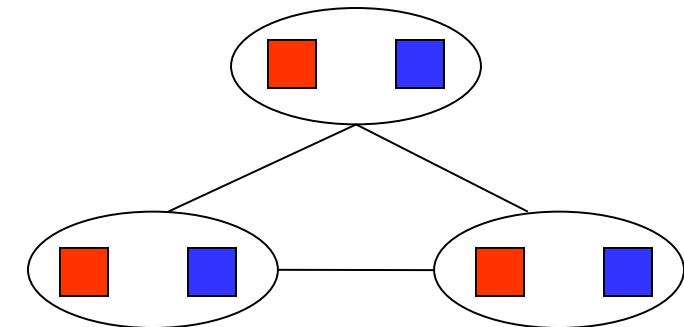

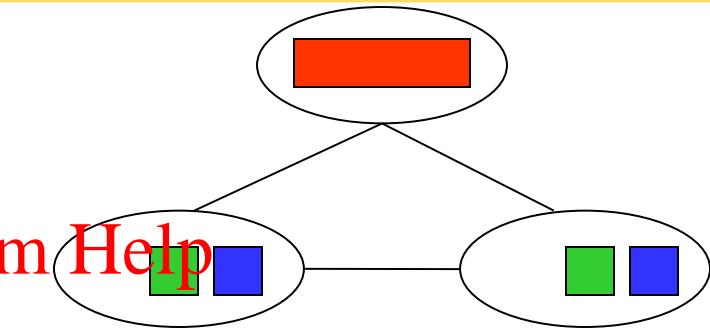

- Runtime:  $O(n^2d^3)$

# Limitations of Arc Consistency

---

- After enforcing arc consistency:
  - Can have one solution left *Assignment Project Exam Help* <https://tutorcs.com>
  - Can have multiple solutions left *WeChat: cstutorcs*
  - Can have no solutions left (and not know it)
- Arc consistency still runs inside a backtracking search!

*What went wrong here?*

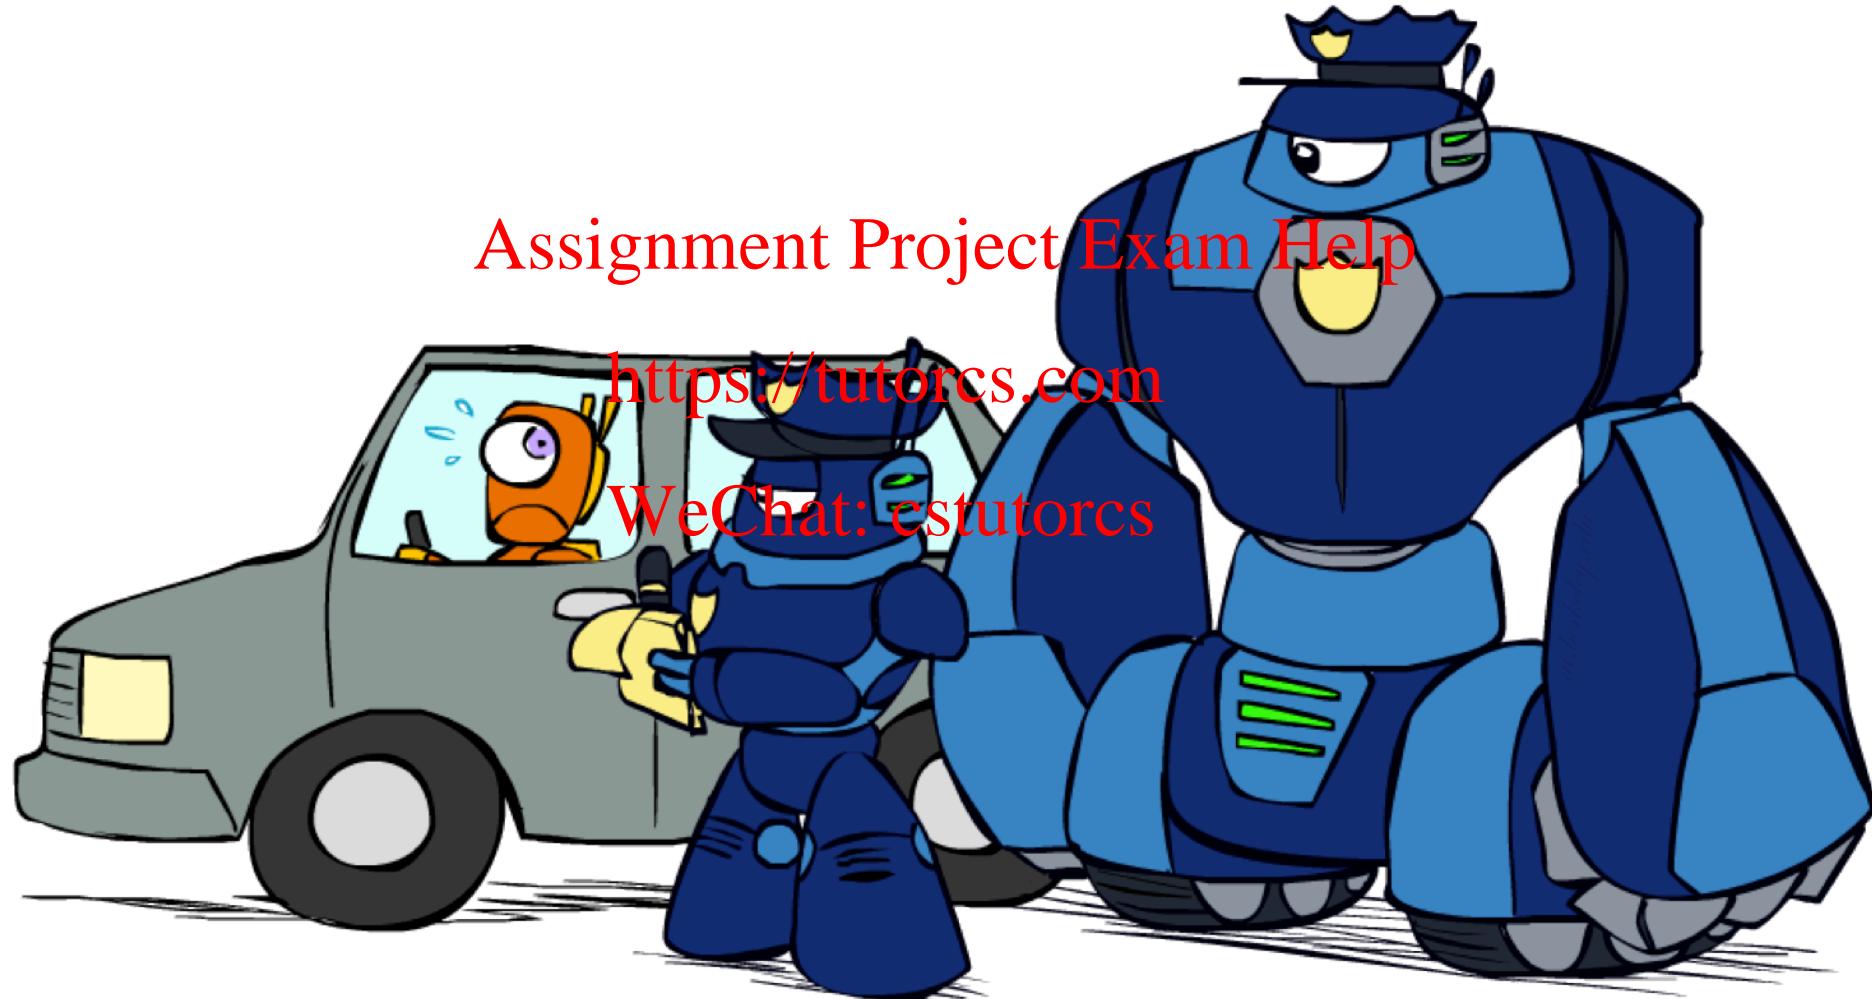

# K-Consistency

---

Assignment Project Exam Help

<https://tutorcs.com>

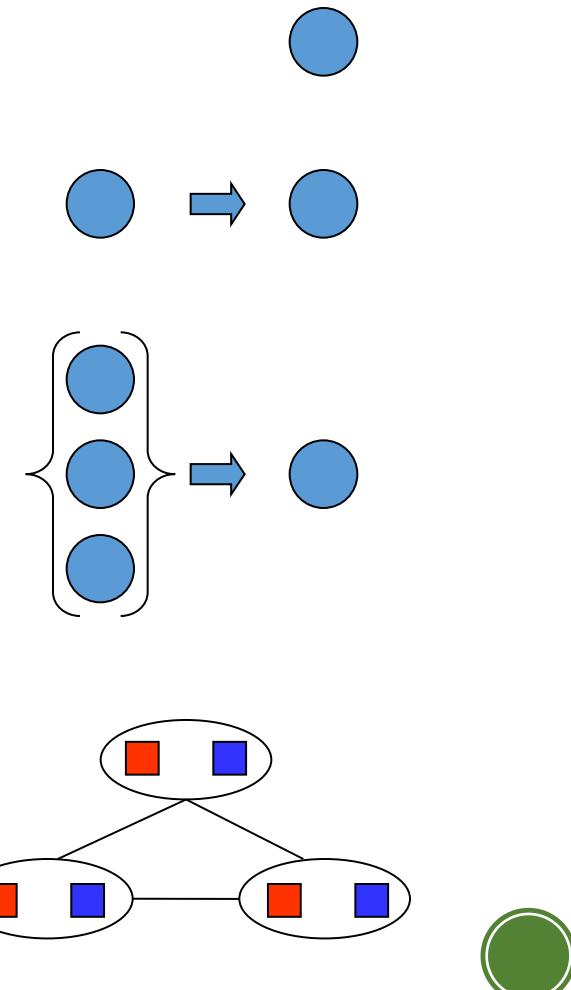

WeChat: cstutorcs

# K-Consistency

- Increasing degrees of consistency

- 1-Consistency (Node Consistency): Each single node's domain has a value which meets that node's unary constraints  
**Assignment Project Exam Help**  
**https://tutorcs.com**
- 2-Consistency (Arc Consistency): For each pair of nodes, any consistent assignment to one can be extended to the other
- K-Consistency: For each k nodes, any consistent assignment to k-1 can be extended to the k<sup>th</sup> node.

- Higher k more expensive to compute

- (You need to know the k=2 case: arc consistency)

# Strong K-Consistency

---

- Strong k-consistency: also k-1, k-2, ... 1 consistent
- Claim: strong n-consistency means we can solve without backtracking!  
**Assignment Project Exam Help**
- Why?
  - Choose any assignment to any variable <https://tutorcs.com>
  - Choose a new variable
  - By 2-consistency, there is a choice consistent with the first
  - Choose a new variable
  - By 3-consistency, there is a choice consistent with the first 2
  - ...
- Lots of middle ground between arc consistency and n-consistency! (e.g. k=3, called path consistency)
