Probabilistic Models

Models describe how (a portion of) the world works

Models are always simplificationment Project Example

May not account for every variable

May not account for all interactibits between variables

• "All models are wrong; but some are useful."

- George E. P. Box

WeChat: cstutorcs

- We (or our agents) need to reason about unknown variables, given evidence
- Example: explanation (diagnostic reasoning)
- Example: prediction (causal reasoning)

Probability Recap

Conditional probability

$$P(x|y) = \frac{P(x,y)}{P(y)}$$

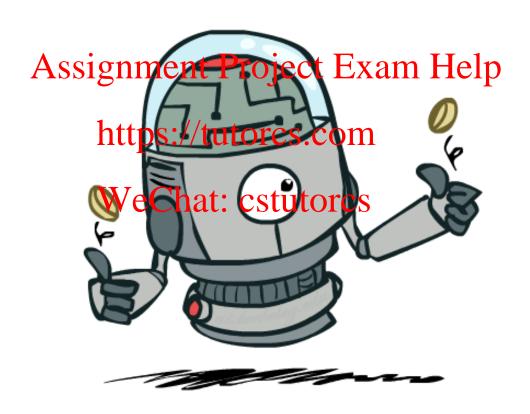

Product rule

Assignment Project PExtenn Pitelp

• Chain rule

$$P(X_1, X_2, \dots, X_n)$$
:/\text{tutorcs.com} \(P(X_1, X_2, \dots, X_n) \):-\text{tutorcs.com} \(P(X_1, X_2, \dots, X_n) \):-\text{1} \\ \text{WeChat: } \frac{1}{2} \text{tutorcs.} \(P(X_2 | X_1) P(X_3 | X_1, X_2) \dots \)

Independence

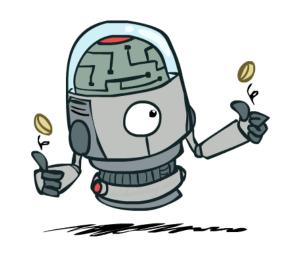

Independence

■ Two variables are *independent* if:

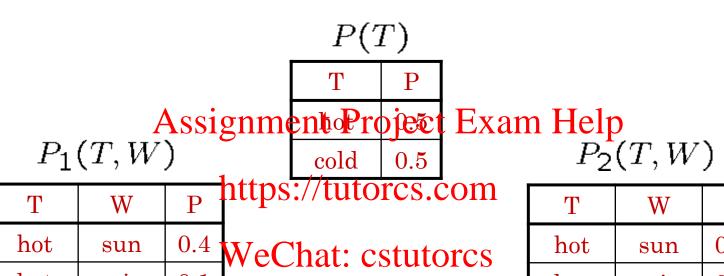

$$\forall x, y : P(x, y) = P(x)P(y)$$

Assignment Project Exam Help

- This says that their joint distribution factors into a product two simpler distributions
 https://tutorcs.com
- Another form: $\forall x, y : P(x|y) \in Ch(x)$ cstutorcs
- We write: $X \perp \!\!\! \perp Y$
- Independence is a simplifying modeling assumption
 - What could we assume for {Weather, Traffic, Cavity, Toothache}?

Example: Independence?

T	W	Р
hot	sun	0.4
hot	rain	0.1
cold	sun	0.2
cold	rain	0.3

P(W)

W	P
sun	0.6
rain	0.4

${f T}$	W	P
hot	sun	0.3
hot	rain	0.2
cold	sun	0.3
cold	rain	0.2

Example: Independence

N fair, independent coin flips:

 $P(X_1)$

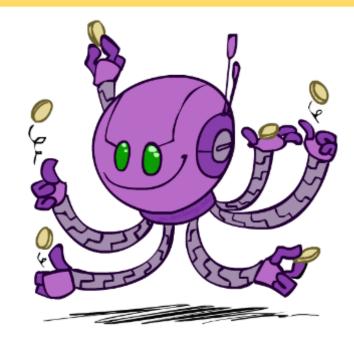

Н	0.5
${f T}$	0.5

 $P(X_2)$ Assignment Project Exam Help

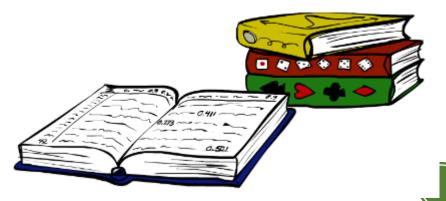

Н	0.5
${f T}$	0.5

https://tutorcs.com

WeChat: cstutorcs

- Unconditional (absolute) independence very rare
- Conditional independence is our most basic and robust form of knowledge about uncertain environments.

https://tutorcs.com

• X is conditionally independent of Y given Z WeChat: cstutorcs

if and only if:

$$\forall x, y, z : P(x, y|z) = P(x|z)P(y|z)$$

or, equivalently, if and only if

$$\forall x, y, z : P(x|z, y) = P(x|z)$$

P(Toothache, Cavity, Catch)

• If I have a cavity, the probability that the probe catches in it doesn't depend on whether I have a toothache:

• P(+catch | +toothache, +cavity) signment Project Exam Nel

• The same independence holds if I don't have a cavity:

• P(+catch | +toothache, -cavity) = P(+catch | -cavity)

We Chat: Cstutorcs

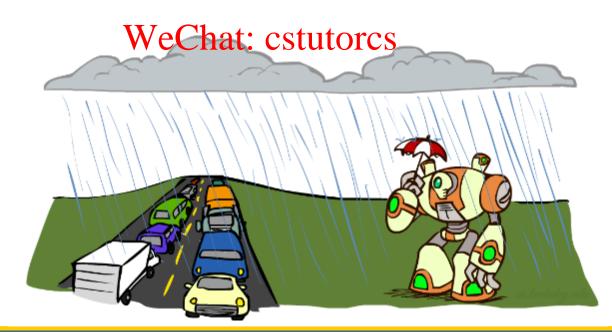

- P(Catch | Toothache, Cavity) = P(Catch | Cavity)
- Equivalent statements:
 - P(Toothache | Catch, Cavity) = P(Toothache | Cavity)
 - P(Toothache, Catch | Cavity) = P(Toothache | Cavity) P(Catch | Cavity)
 - One can be derived from the other easily

- What about this domain:
 - Traffic
 - Umbrellassignment Project Exam Help
 - Raining

https://tutorcs.com

• What about this domain:

Fire

Smoke Assignment Project Exam Help

Alarm

https://tutorcs.com

WeChat: cstutorcs

Conditional Independence and the Chain Rule

• Chain rule:

$$P(X_1, X_2, ... X_n) = P(X_1)P(X_2|X_1)P(X_3|X_1, X_2)...$$

Trivial decomposition: Assignment Project Exam Help

 $P(\mathsf{Traffic}, \mathsf{Rain}, \mathsf{Umbrella})$ $\overline{\mathsf{https://tutorcs.com}}$ $P(\mathsf{Rain})P(\mathsf{Traffic}|\mathsf{Rain})P(\mathsf{Umbrella}|\mathsf{Rain}, \mathsf{Traffic})$ $\mathsf{WeChat: cstutorcs}$

• With assumption of conditional independence:

$$P(\mathsf{Traffic}, \mathsf{Rain}, \mathsf{Umbrella}) = P(\mathsf{Rain})P(\mathsf{Traffic}|\mathsf{Rain})P(\mathsf{Umbrella}|\mathsf{Rain})$$

Bayes'nets / graphical models help us express conditional independence assumptions

Ghostbusters Chain Rule

Each sensor depends only on where the ghost is

P(T,B,G) = P(G) P(T|G) P(B|G)

That means, the two sensors are conditionally independent, given the ghost position https:/

T: Top square is red

B: Bottom square is red G: Ghost is in the top

Bayes' Nets: Big Picture

Bayes' Nets: Big Picture

 Two problems with using full joint distribution tables as our probabilistic models:

• Unless there are only a few variables, the joint is WAY

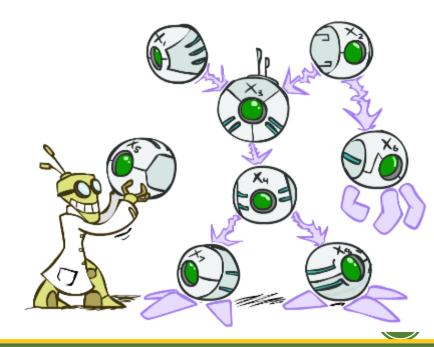

too big to represent explicitly.

Hard to learn (estimate) anything empirically about more than a few variables at a time

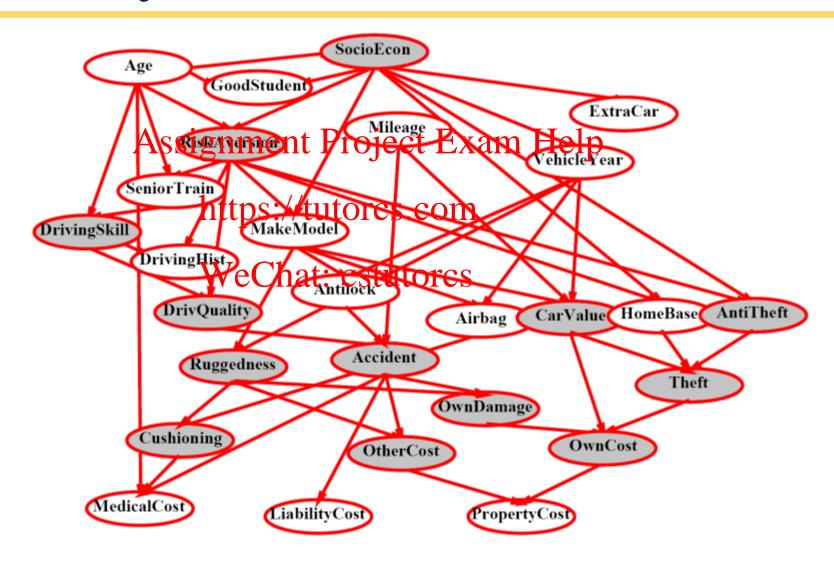

https://tutorcs.com

- Bayes' nets: a technique for dyscribing: complexigint distributions (models) using simple, local distributions (conditional probabilities)
 - More properly called graphical models
 - We describe how variables locally interact
 - Local interactions chain together to give global, indirect interactions
 - For about 10 min, we'll be vague about how these interactions are specified

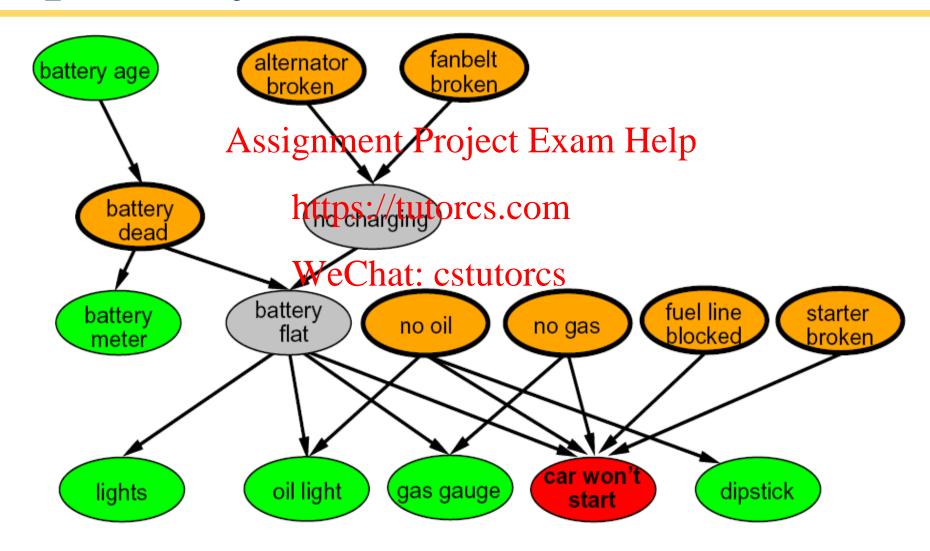

Example Bayes' Net: Insurance

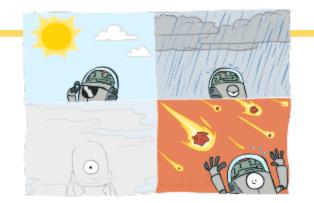

Example Bayes' Net: Car

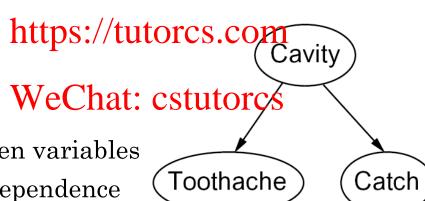

Graphical Model Notation

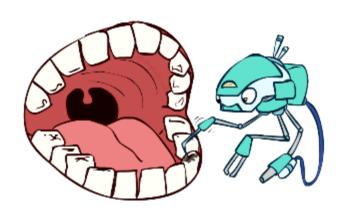

- Nodes: variables (with domains)
 - Can be assigned (observed) or unassigned (unobserved)
 Assignment Project Exam Help

- Arcs: interactions
 - Similar to CSP constraints
 - Indicate "direct influence" between variables
 - Formally: encode conditional independence (more later)

Weather

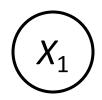

• For now: imagine that arrows mean direct causation (in general, they don't!)

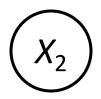

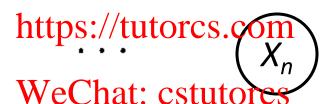

Example: Coin Flips

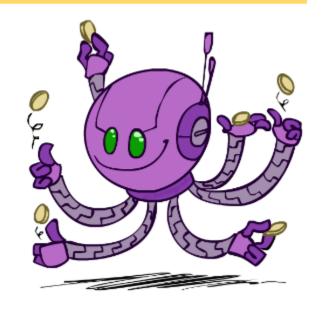

N independent coin flips

Assignment Project Exam Help

•No interactions between variables: absolute independence

Example: Traffic

- Variables:
 - R: It rains
 - T: There is traffic

Model 1: independence

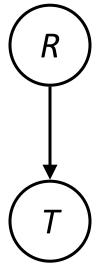

https://tumpgeromain causes traffic

WeChat: cstutorcs

T

• Why is an agent using model 2 better?

Example: Traffic II

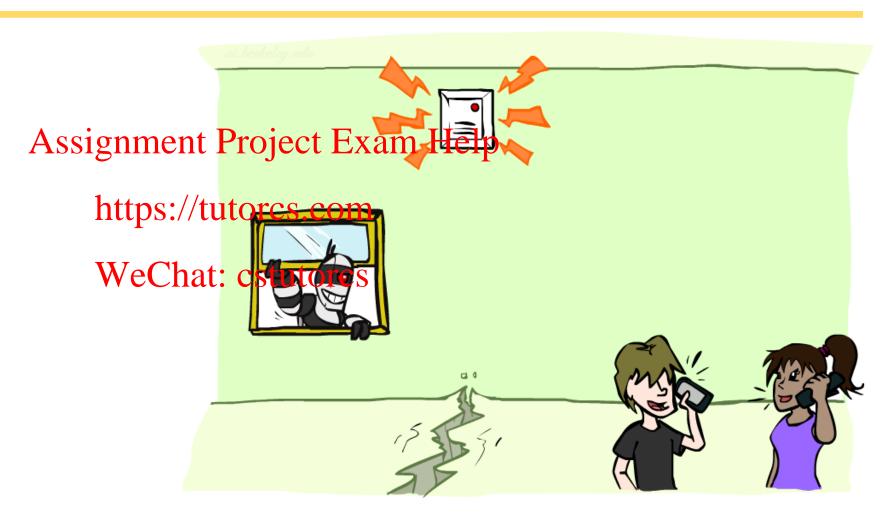

Let's build a causal graphical model!

- Variables
 - T: Traffic
 - R: It rains
 - L: Low pressure
 - D: Roof drips
 - B: Ballgame
 - C: Cavity

Example: Alarm Network

- Variables
 - B: Burglary
 - A: Alarm goes off
 - M: Mary calls
 - J: John calls
 - E: Earthquake!

Bayes' Net Semantics

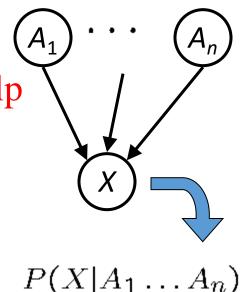

Bayes' Net Semantics

- A set of nodes, one per variable X
- A directed, acyclic graph Assignment Project Exam Help
- A conditional distribution for teacher edem
 - A collection of distributions over X, one for each combination of parents values cstutores

$$P(X|a_1\ldots a_n)$$

- CPT: conditional probability table
- Description of a noisy "causal" process

 $A\ Bayes\ net = Topology\ (graph) + Local\ Conditional\ Probabilities$

Probabilities in BNs

- Bayes' nets implicitly encode joint distributions
 - As a product of local conditional distributions
 - Assignment Project Exam Help

 To see what probability a BN gives to a full assignment, multiply all the relevant conditionals together:

 https://tutorca.com

$$P(x_1, x_2, \dots x_n) = \prod_i P(x_i | parents(X_i))$$

WeChat: cstatorcs

• Example:

P(+cavity, +catch, -toothache)

Probabilities in BNs

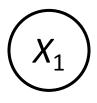

Why are we guaranteed that setting

$$P(x_1, x_2, \dots x_n) = \prod_{i=1}^n P(x_i | parents(X_i))$$

results in a proper joint distribution ent Project Exam Help

- Chain rule (valid for all distribulations: // type $(x_i | x_1 \dots x_{i-1})$
- Assume conditional independent Chatrest x_i : $x_{i-1} = P(x_i | parents(X_i))$
 - \rightarrow Consequence: $P(x_1, x_2, \dots x_n) = \prod_{i=1}^n P(x_i | parents(X_i))$
- Not every BN can represent every joint distribution
 - The topology enforces certain conditional independencies

Example: Coin Flips

 X_2 ... X_n Assignment Project Exam Help

 $P(X_1)$

Size of a Bayes' Net

 How big is a joint distribution over N Boolean variables?
 2^N ■ Both give you the power to calculate $P(X_1, X_2, ..., X_n)$

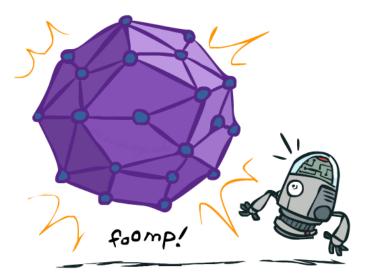

Assignment Project Next that delpace savings!

• How big is an N-node net in the destutores. Adomeasier to elicit local CPTs have up to k parents?

 $O(N * 2^{k+1})$

WeChat: cstutdscsfaster to answer queries (coming)

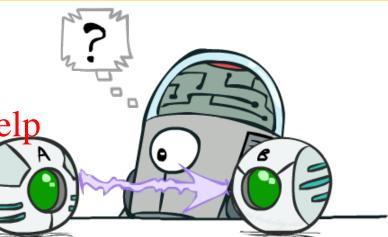

Causality?

- When Bayes' nets reflect the true causal patterns:
 - Often simpler (nodes have fewer parents)
 - Often easier to think about
 - Often easier to elicit from expansignment Project Exam Help
- BNs need not actually be causalhttps://tutorcs.com
 - Sometimes no causal net exists over the domain (especially if variables are missing)
 WeChat: cstutorcs
 - E.g. consider the variables *Traffic* and *Drips*
 - End up with arrows that reflect correlation, not causation
- What do the arrows really mean?
 - Topology may happen to encode causal structure
 - Topology really encodes conditional independence

$$P(x_i|x_1,\ldots x_{i-1}) = P(x_i|parents(X_i))$$

Bayes' Nets

• So far: how a Bayes' net encodes a joint distribution

• Next: how to answer queries ignment Project Exam Help

distribution

Today:

• First assembled BNs using an intuitive notion conditional independence as causality

 Then saw that key property is conditional independence

■ Main goal: answer queries about condition a independence and influence

 After that: how to answer numerical queries (inference)
